

Massive blackouts

We don't have to think that when a blackout occurs somewhere in a city, it's strange; but when this is repeated mysteriously and in various cities of the world, and in a very short interval then, we have to say that isn't normal. In our daily life nothing's normal, This is the problem.

We could think anything about it and anyone could be good or not, but the case is that the transformers do not explode because; there always has to be a logical reason for everything, or at least it is what it should be.

Not long ago there was a massive blackout in Argentina and Uruguay, here we no longer speak of a transformer, but of an entire electricity network that left the city in the dark for hours, these types of phenomena are not only not rare but we could say that it is almost impossible that in our days this can happen without more.

There are many theories that could shed some light on the subject, but sometimes the most absurd could be the good one. Criminal acts, cyberataque, conspiracies, etc. but there are some others that should be considered, such as controlled electromagnetic impulses, extraterrestrial intervention, etc. But the reason for all this is unknown, at least for most of us who are the ones who suffer this kind of phenomena.

We cannot rule out that the problem comes from abroad, because if we think logically and wrongly we could think that a country like the United States is testing new weapons, but that they do it in their own territory seems a bit foolish; but you never know what goes through the minds of those who hold power. Now, so many blackouts could be a clear intention to test the reaction of the population to something that could come more seriously from both the hand of man and an external factor.

Currently phenomena such as unusual heat waves are occurring in some parts of the planet; The official media blame these for some blackouts. What is certain is that in some countries they are being forced to temporarily shut down some nuclear power plants to avoid overheating water in their reactors, but this does not mean that an entire city is left in the dark; there are other plants that can supply energy without problems until temperatures drop.

Heat waves have occurred in the past and have never been caused of massive blackouts; So why are so many and in such a short time? We know that our magnetic field is undergoing drastic changes, which means that the reversal of the poles could be one of the causes of these blackouts. The weakening of the magnetosphere can cause all kinds of unpredictable phenomena that will increase as time passes, and this will not be good for anyone. Without our magnetic field we will be exposed to all types of radiation; It would be like being in a microwave.

Massive blackouts

Anyway you have to be aware of future events, because there are no coincidences that can explain what is happening all over the planet.
